TOPIC : QUANTUM ERROR CORRECTION CODES AND DECODERS .

DATE : JANUARY 12, 2025.

HOURL : 7 PM UTC - 8 PM CET.

ABSTRACT : We believe that the next revolution is quantum involving the use of exponentially powerful computers called quantum computers. In these early days of such revolution, quantum computers face crucial challenges among which handling the noise. To overcome this challenge, scientists are developing algorithms to either make the computers fault tolerant or correct where the noise corrupts the information.

In this talk, we will introduce some of the quantum error correction codes and how they work.

KEYWORDS : Quantum computers, Quantum error correction, Noise, Fault-tolerant, Quantum computing.

BIOGRAPHY : Aulan Lucrèce Zahoundo is a PhD. student affiliated with the African Institute for Mathematical Sciences (AIMS) in quantum computing. She holds an MSc in theoretical physics from IMSP in Benin and a Master of Philosophy in quantum computing at Quantum Leap Africa in Rwanda.
